

ValveTriage Service

Typically thirty percent of control valves have issues needing attention. Are the right valves being repaired? A valve malfunction will decrease reliability. Time and money can be saved by focusing attention to right issues and establishing a corrective action plan.

ValveTriage Service reveals valves disturbing the process and prioritizes the actions based on the process effect.

A challenge in maintenance planning is to focus maintenance actions on devices needing adjustment or repair and avoid unnecessary maintenance of devices in good health.

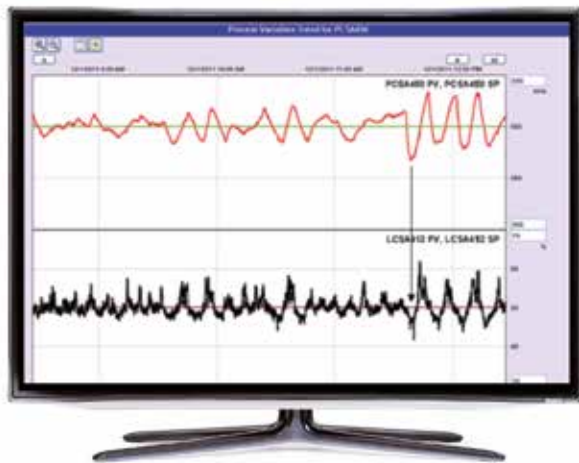

ValveTriage Service detects devices that disturb the process. The known condition creates the foundation for efficient maintenance planning and action prioritization.

ValveTriage Service analyses the devices in control loops using existing process measurements. The analysis is based on ExpertTune technology.

It works with any control valve or sensor regardless of the type and manufacturer. The findings are prioritized based on the severity of the problem and the economic significance of the devices.

As a result, ValveTriage Service provides prioritized list of devices with recommended maintenance actions.

Benefits

- Improves process performance
- Focuses maintenance actions on the right devices needing attention
- Detects process bottlenecks
